# ABOUT INTECO PTI

## HOW TO CONTROL MATERIAL INJECTION AT ITS BEST

### Process optimization

INTECO PTI's carbon injection system is designed to balance carbon distribution while minimizing carbon consumption. By injecting carbon to multiple points within the EAF, it provides a more consistent, foamy slag and a more homogenous steel bath. Since the carbon injection system is fully automatic, it frees up valuable operator time to concentrate on steelmaking.

### Multiple injection points via INTECO PTI's new rotary feed technology

The carbon injection system can be customized for up to 3 injection points, all from a single vessel. With fewer vessels required, it saves floor space and money! Single and dual outlets are also available in traditional pneumatic conveying method with knife gates if there is no need for a rotary.

### Automated maintenance

The carbon injection system is self diagnostic and self adjusting. Features within the vessel help minimize carbon port plugging and ensure an even and consistent carbon flow. The carbon injection system has a self-diagnostic system that monitors the carbon flow along with critical system parameters. A robust design with high quality components, the carbon injection system will make carbon injection to any EAF virtually headache free.

## WHO WE ARE...

As a member of the INTECO Group since 2013, we contribute 30 years of expertise to an international successful group with a leadership in metallurgical process technology and equipment for melting, refining, casting, remelting and atomization for high performance steels, superalloys and titanium. Our dedicated team of qualified engineers, metallurgists and technical support staff with subsidiaries in Europe and Shanghai ensure global customer satisfaction.

## WHAT WE DO...

Our core competencies within the group lie in high-tech applications, particularly chemical energy systems for electric arc furnaces, including oxy-fuel burners, material injection systems as well as control and automation systems, pre-heating and drying combustion systems to enhance efficiency, productivity and safety. We offer full-service combustion and injection solutions, including design, engineering, manufacturing, testing, commissioning, training and process optimization.

## WHAT WE AIM FOR...

Always eager to further develop our products and serve you – our valued customer – with the best equipment possible, we conduct research and submit patents for our innovative and tailor-made solutions.

### Injection system upgrades

INTECO PTI has made a lot of upgrades to our injection technologies over the years. If you have an older system that is in need of upgrading, we can easily refurbish it with our newest technology package to make it in line with our current equipment in the steel industry.

### Automation

INTECO PTI's carbon system is PLC controlled. To fit your needs, the PLC may be mounted directly on the vessel structure, or located remotely. INTECO PTI can customize its vessel automation systems to integrate with your current systems in order to reduce redundant control interfaces.

### Closed loop flow control

A closed loop control of the vessel pressure and transport air flow regulates the carbon flow rate. The opening and closing of a cycling, carbon feed valve does not interrupt the carbon flow. With virtually no moving parts during the injection process, the carbon system lasts longer and requires less maintenance. Additionally, less floor space, fewer vessels and reduced maintenance make the INTECO PTI carbon injection system a "no brainer" for any melt shop!

## Our Technology – Your Advantage

- › INTECO PTI's new rotary feed technology with three outlets
- › Closed loop control flow and controlled carbon flow rates injected during melting
- › Multiple injection points are available from a single source vessel
- › System is self adjusting and self diagnostic
- › Delivers uninterrupted flow of carbon to the EAF
- › New anti-clogging software
- › Injector integrates with existing operation system
